

Met Office

SST in Climate Research

Roger Saunders, Met Office

with inputs from Nick Rayner, John Kennedy, Rob Smith, Karsten Fennig, Sarah Millington, Owen Embury.

This work is supported by the Joint DECC and Defra Integrated Climate Programme - DECC/Defra

Diversity of measurements

Not a stable observing system

Percentage of observations coming from SHIPS and DRIFTERS

(A)ATSR - the solution!

- Single Platform
- Low measurement errors
- Low bias drift

SST definitions

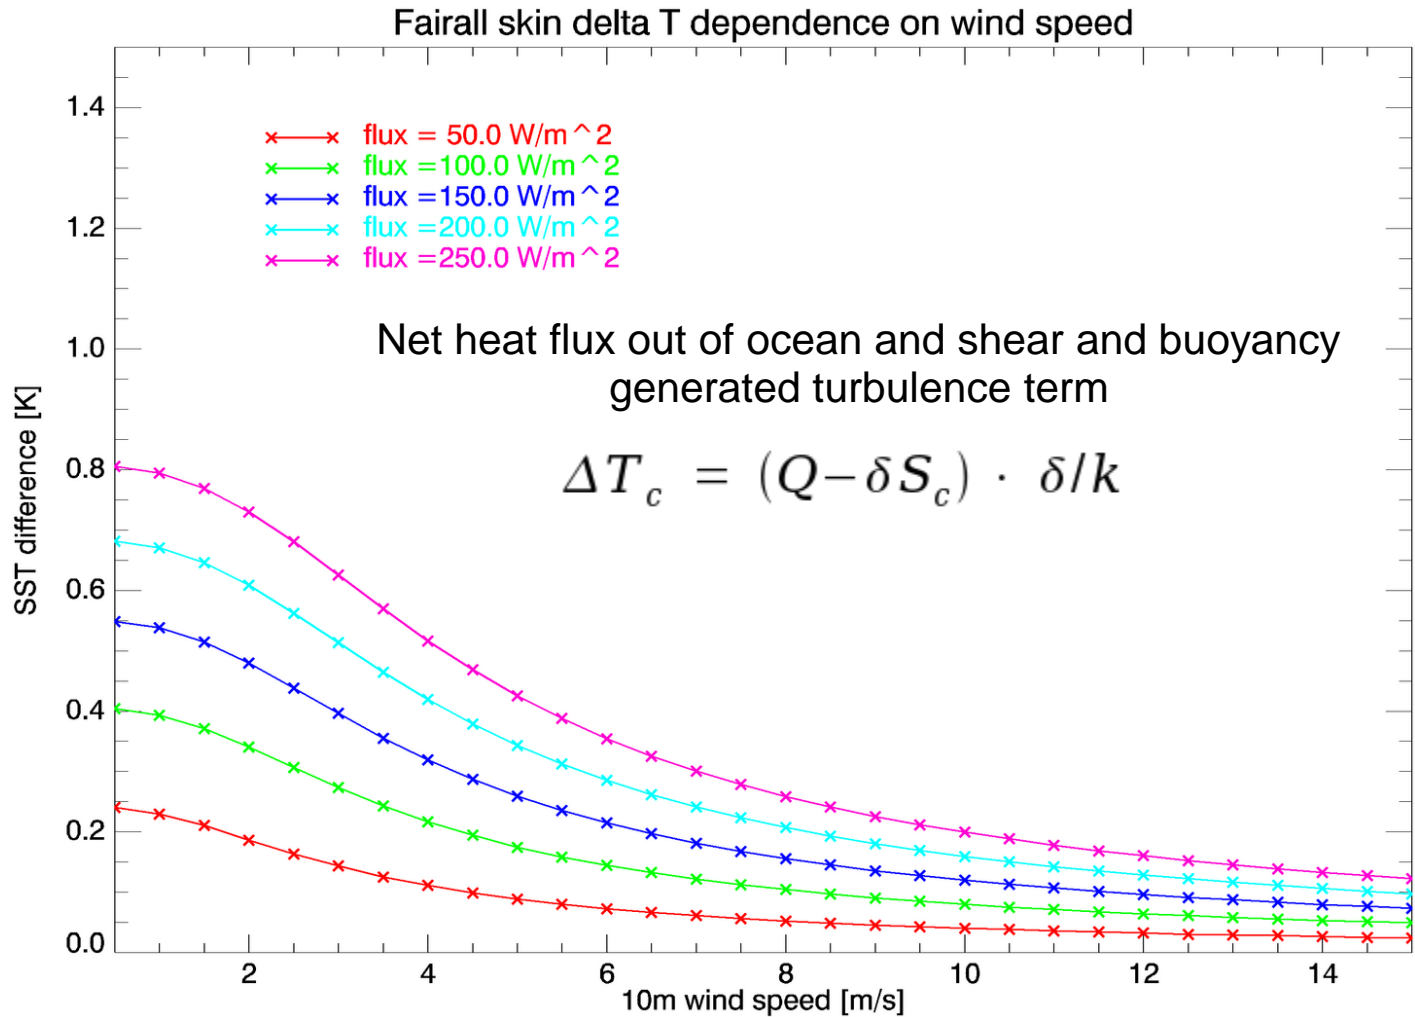

k0424020 www.fotosearch.com

Buoys measure at
Depths
~0.6m

Skin effect model

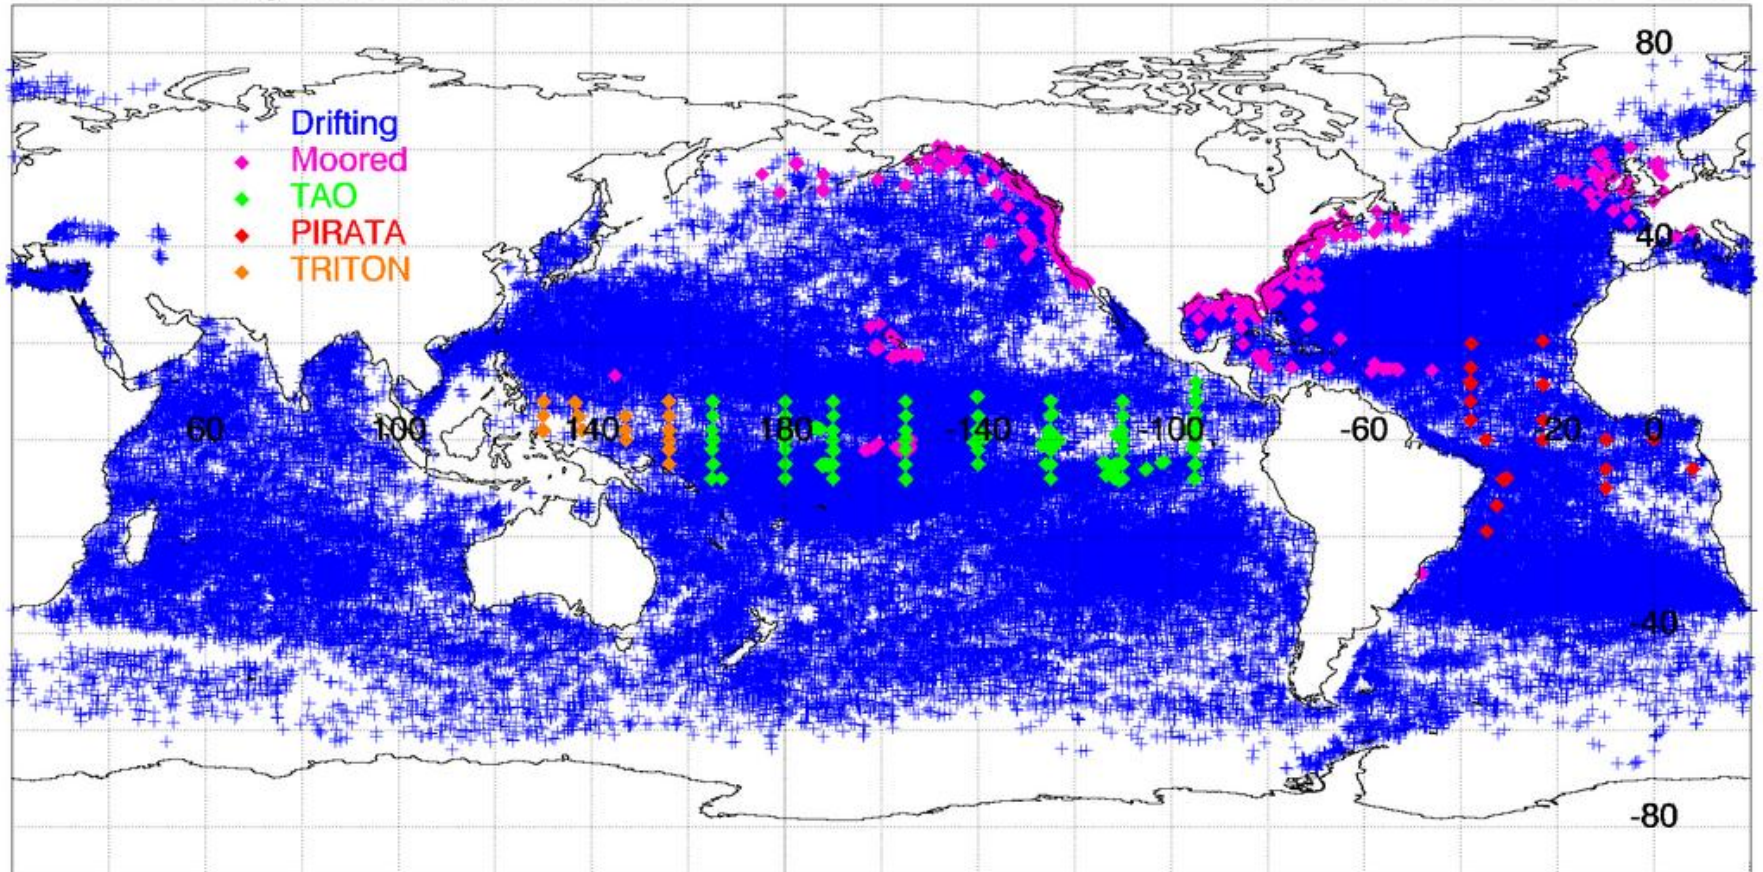

Buoy matchup database

AATSR : buoy matchup distribution

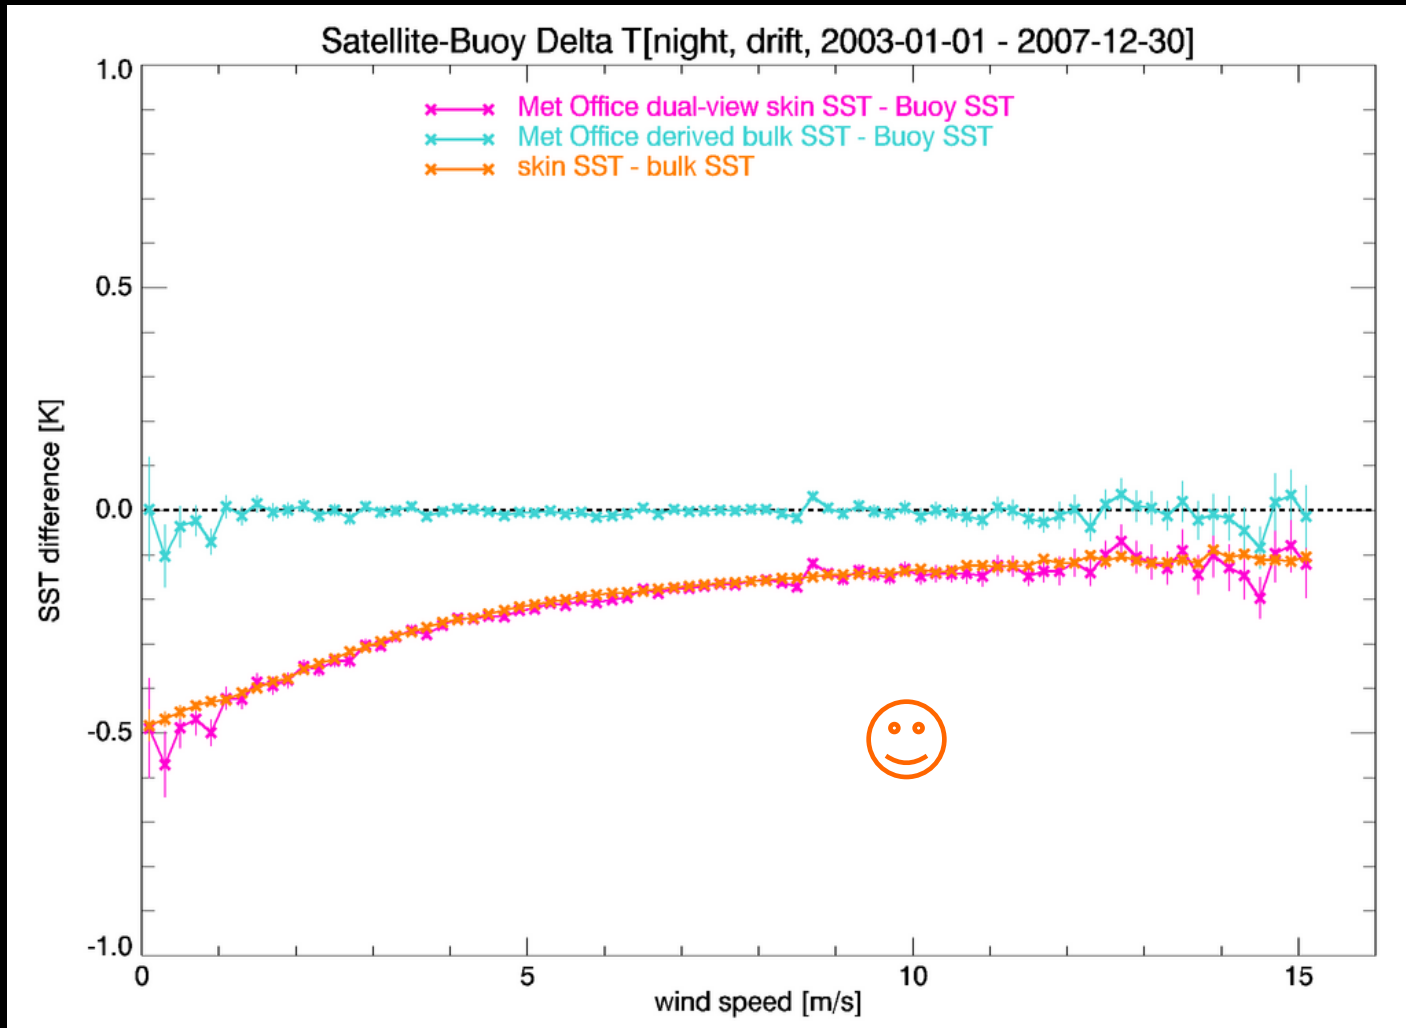

2002-08-02 to 2007-12-31

number of obs = 131017

Validation of skin effect model

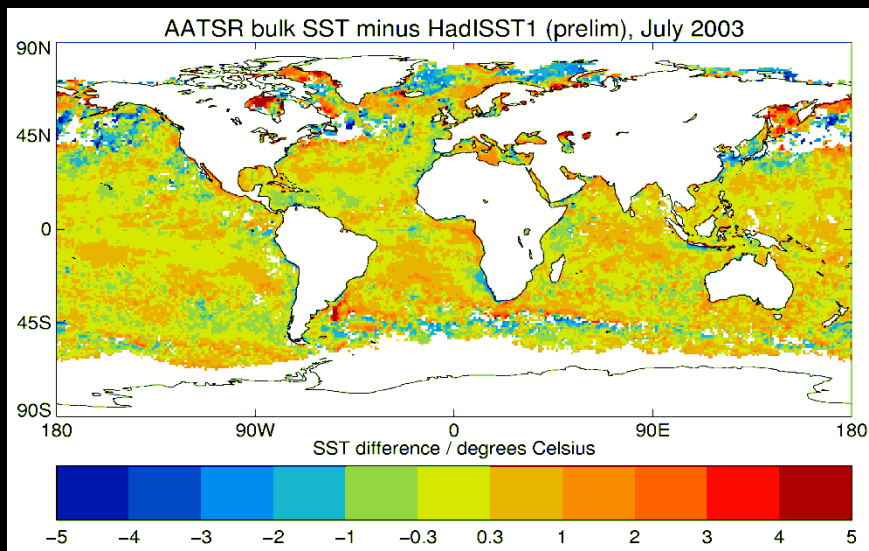

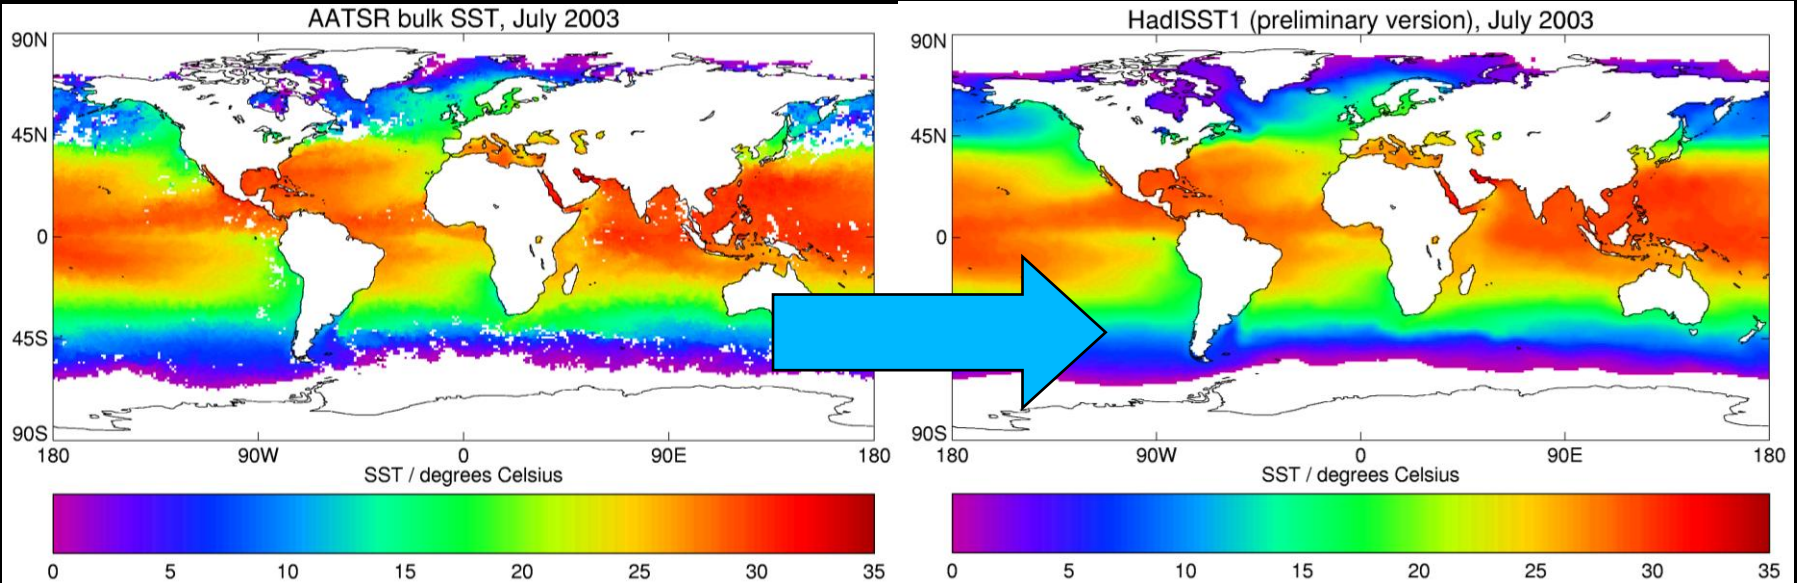

Mean differences, night D3, drifter

Met Office

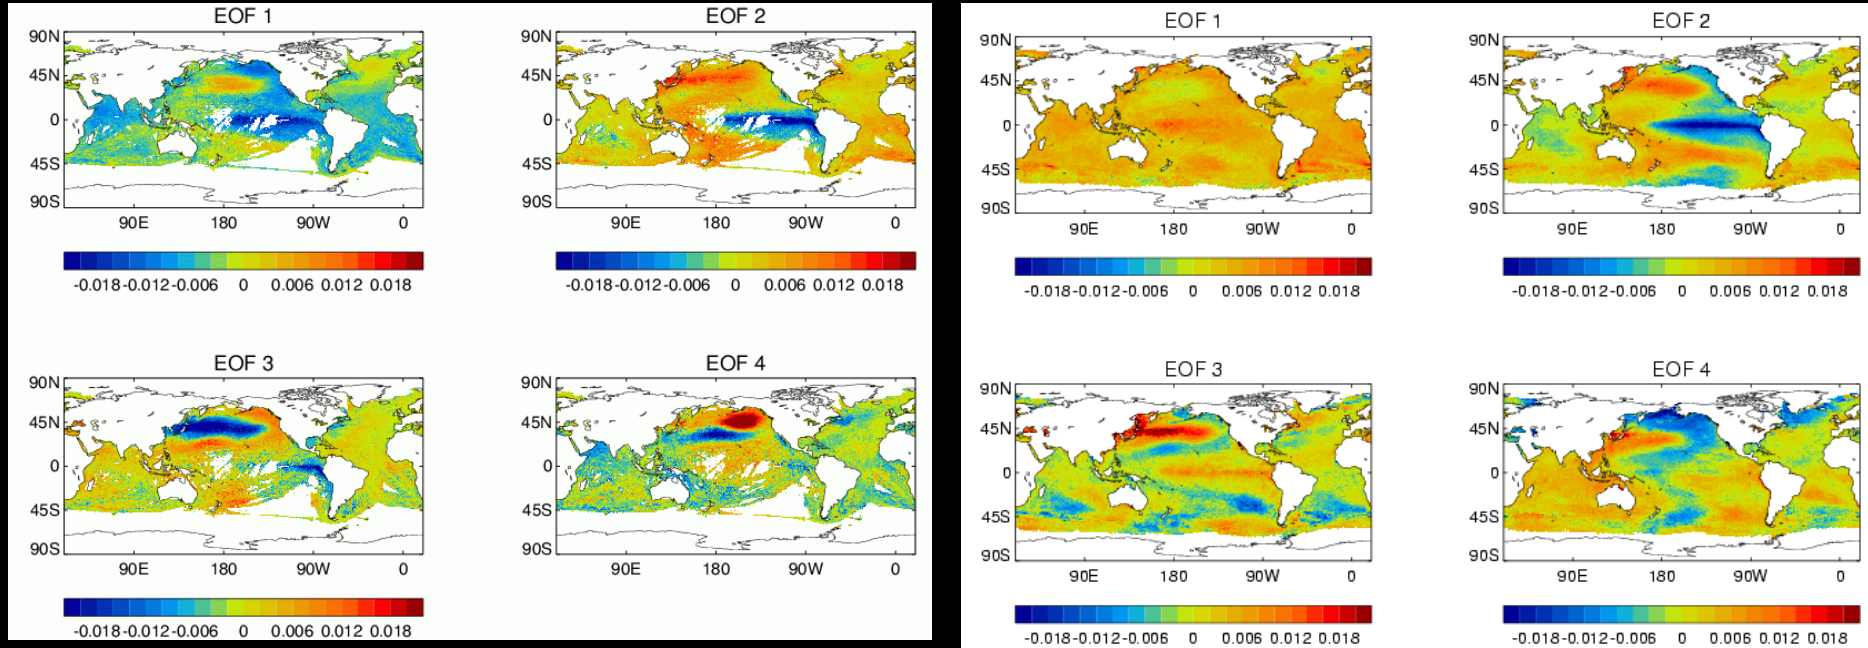

Good global coverage

- To deliver high quality bulk (A)ATSR SST product to Hadley Centre from 1991-2013 for assimilation into HADiSST
- Provide *the* reference SST climate data record for this period and understand biases with in-situ and other satellite datasets

EOFs of SST field for reconstructing historical analyses

In-situ data only

In-situ + ATSR + AVHRR data

Data voids removed

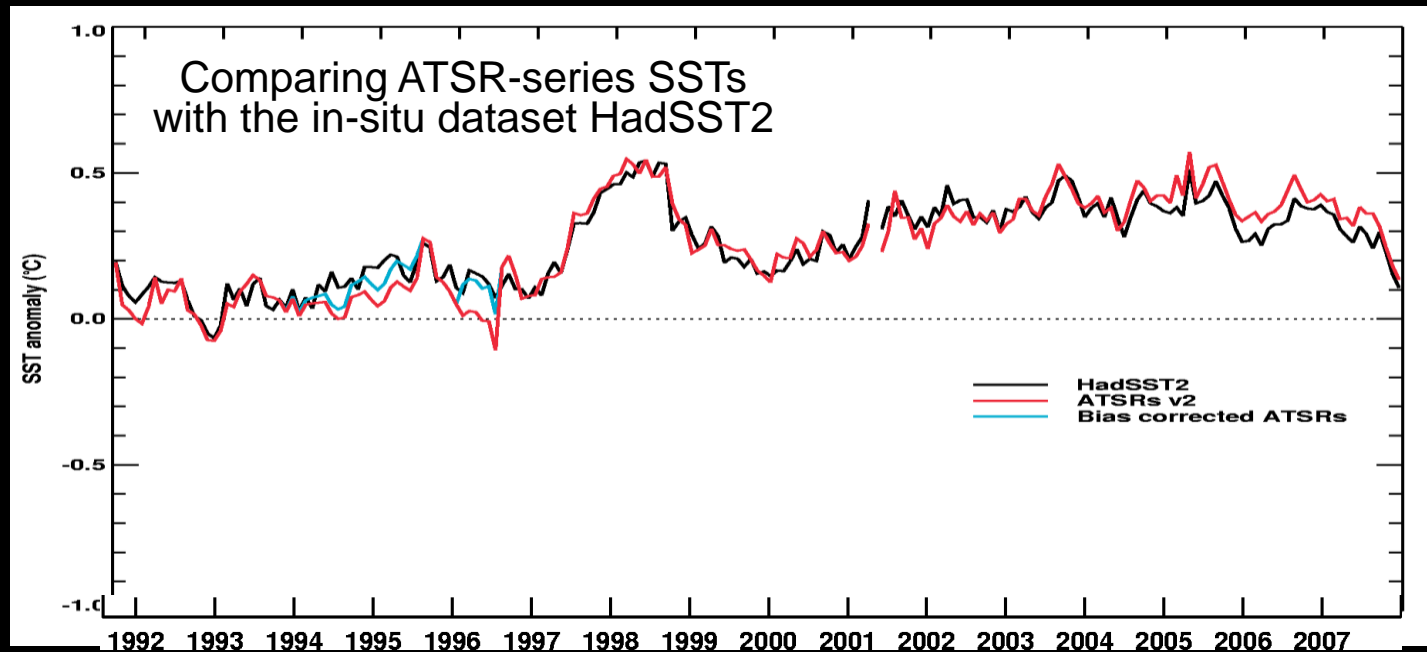

Allows SST fields before the satellite era to be estimated

Time series of satellite SSTs

AVHRR bias correction:

- Uses ATSR as reference
- Uses TOMS to correct for aerosol effects

SST anomaly:

Observed SST vs.
1961-1990 climatology

AVHRR bias correction:

- Uses ATSR as reference
- Uses TOMS to correct for aerosol effects

SST anomaly:

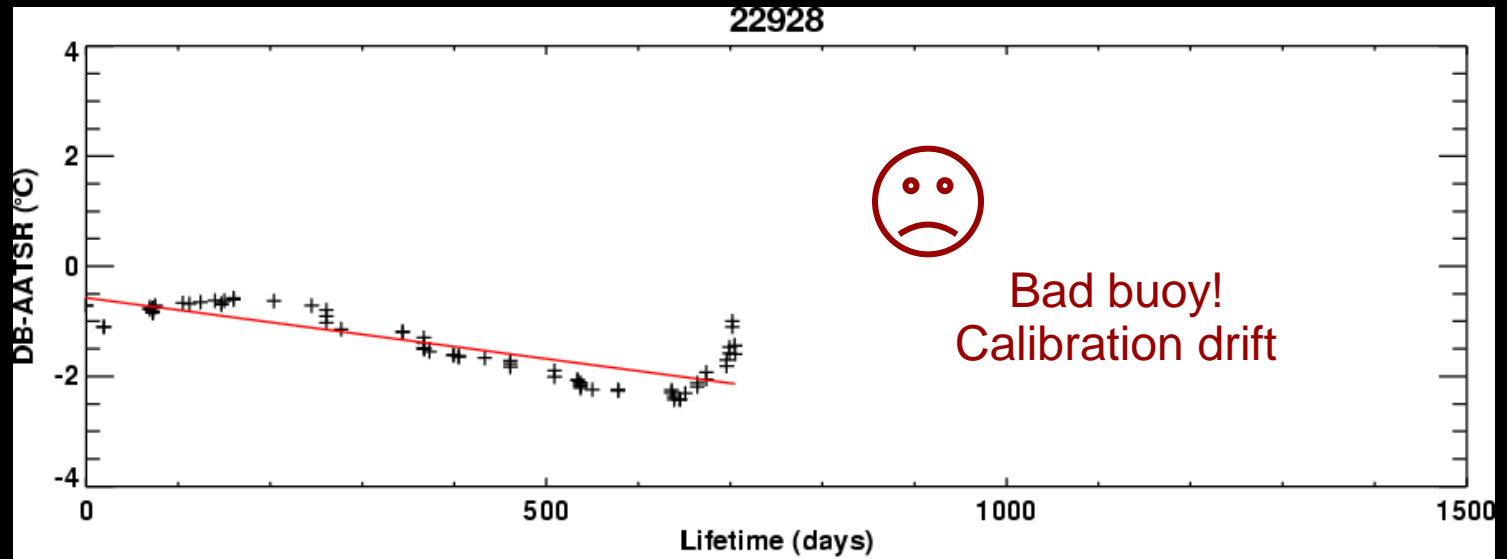

Observed SST vs.
1961-1990 climatology

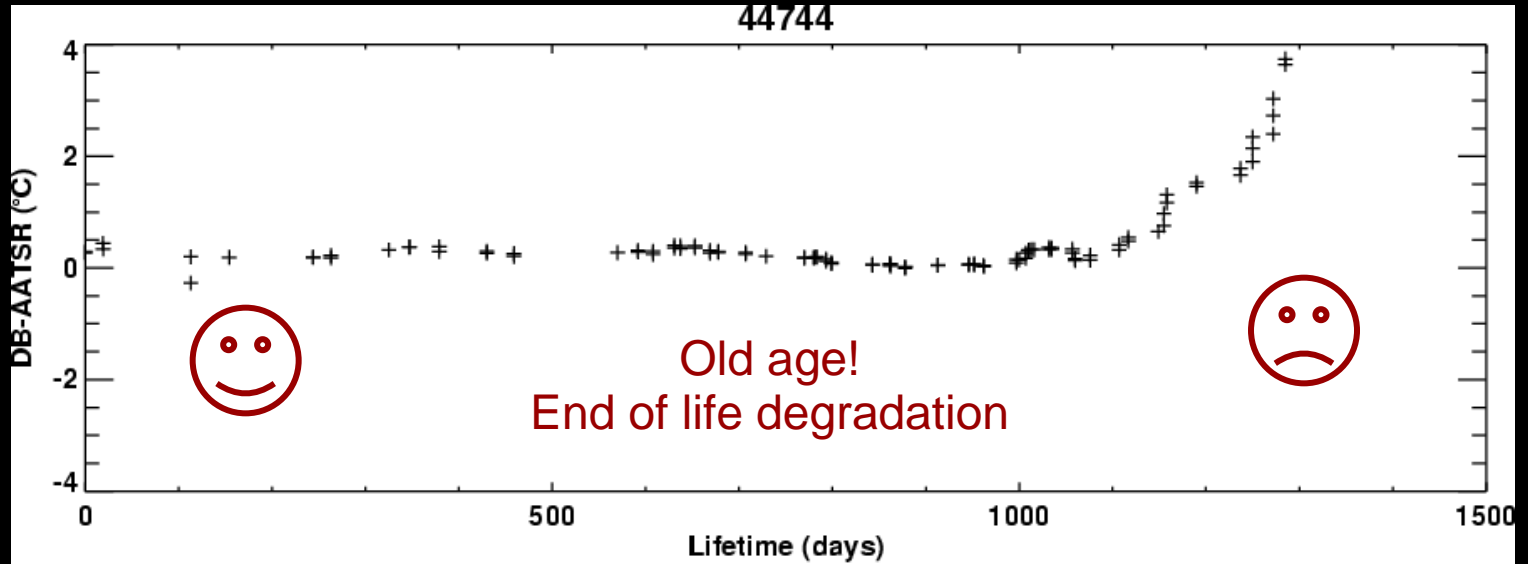

Monitoring the buoy network (1)

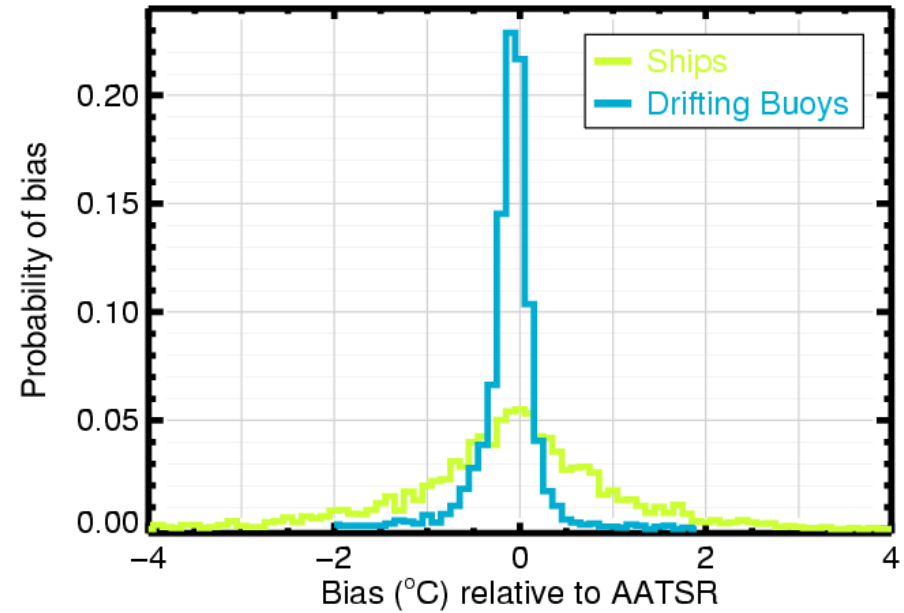

Monitoring the buoy network (2)

Monitoring the buoy network (3)

Measurement and bias errors distributions of in-situ data

Measurement error and bias error distributions.

Ships are more error prone than drifters although both can have large biases

Bias component implies errors are correlated

Deriving a sea surface temperature record suitable for climate change research from the along-track scanning radiometers

(A)ATSR Re-analysis for Climate: ARC

<http://arc.geos.ed.ac.uk>

Chris Merchant, University of Edinburgh and many others

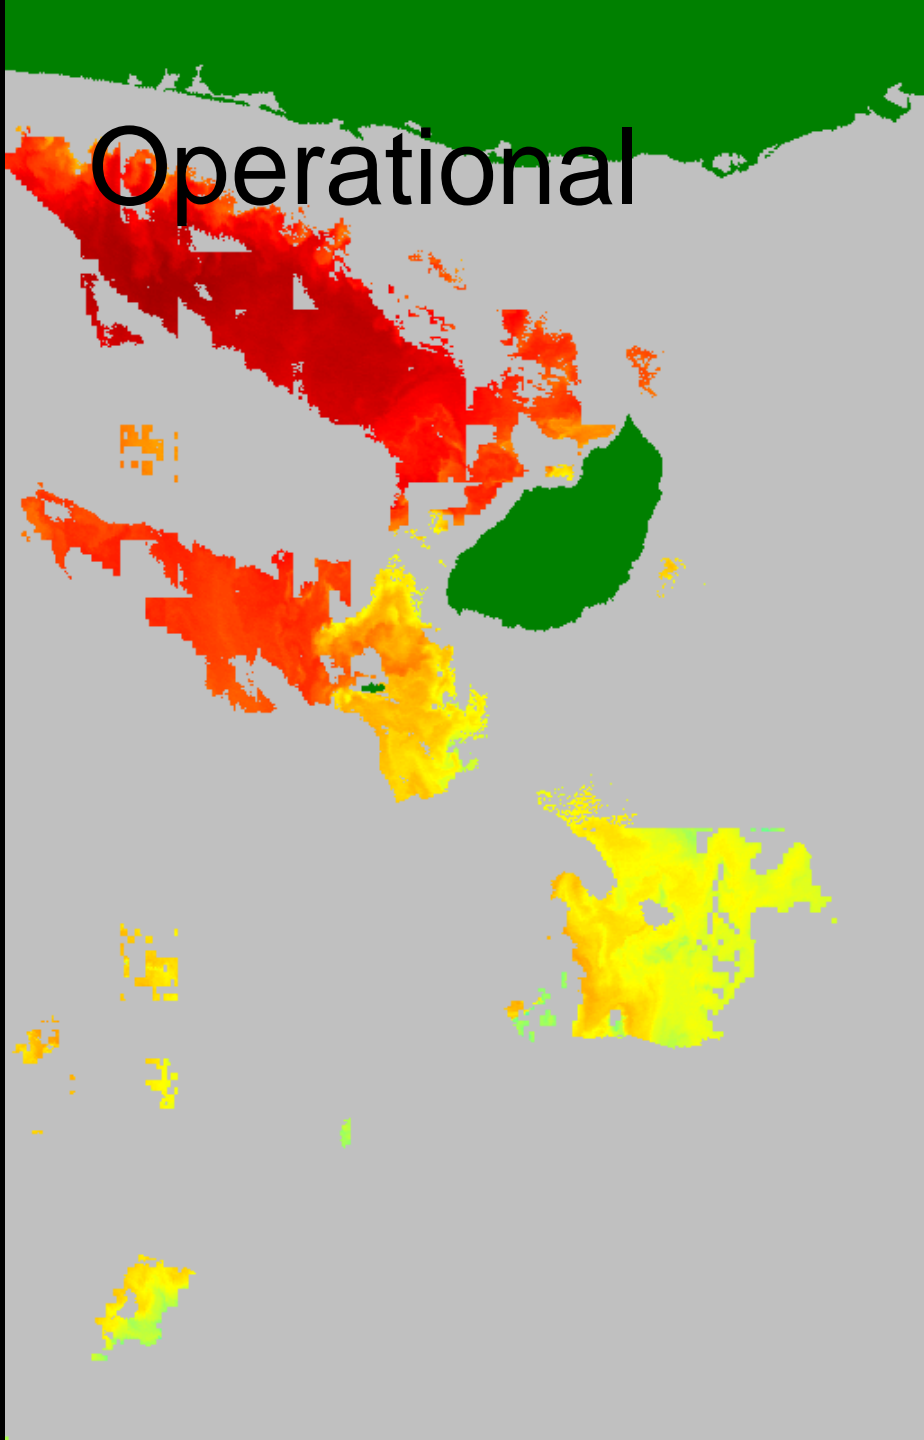

Met Office

ARC Improvements

- **Cloud detection**
 - **Bayesian cloud detection makes use of NWP data**
 - **Reduces false alarm rate giving better coverage in important regions (Arctic, gulf stream, coastal)**
 - **Increases hit rate**
- **Aerosol**
 - **Detects Saharan dust over the Atlantic during summer**
- **Sea ice**
 - **Can distinguish sea-ice from open water**
- **SST algorithm**
 - **New technique using up-to-date spectroscopy**
 - **Reduces bias and noise and improved day/night consistency**
- **Skin to Bulk correction**
 - **Improved validated model**

Operational

Better cloud detection

ARC

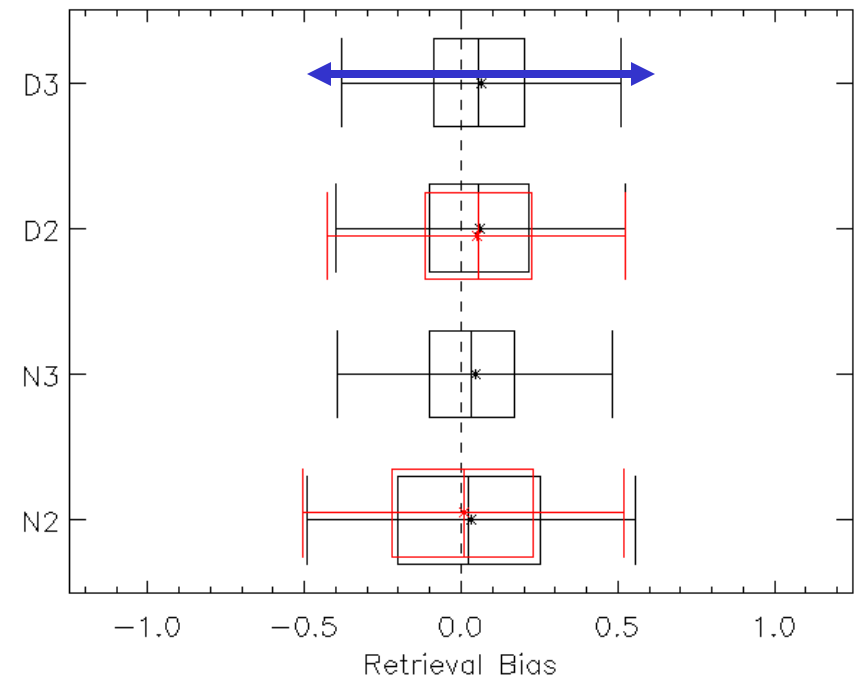

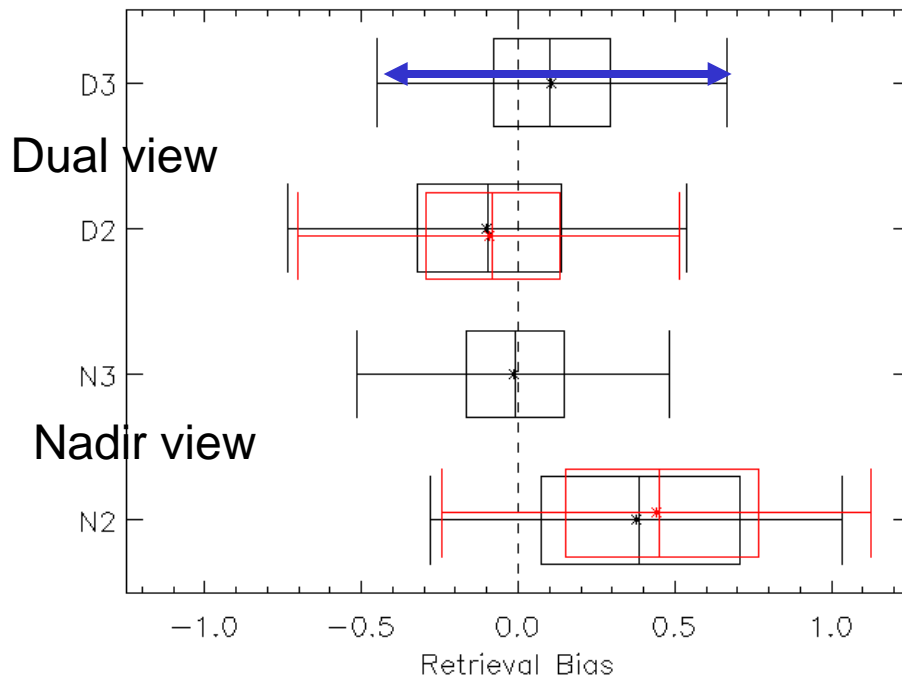

Better cloud detection

SST retrieval error reduced

ESA Operational

ARC

Smaller errors

Met Office

Global Satellite Intercalibration Calibration System Simultaneous Nadir Overpass (SNO) Method

POES intercalibration

- Useful for remote sensing scientists, climatologists, as well as calibration and instrument scientists
- Potential for (A)ATSR and geo or polar matches

- Has been applied to microwave, vis/nir, and infrared radiometers for on-orbit performance trending and climate calibration support
- Capabilities of 0.1 K for sounders and 1% for vis/nir have been demonstrated in pilot studies

GOES vs. POES

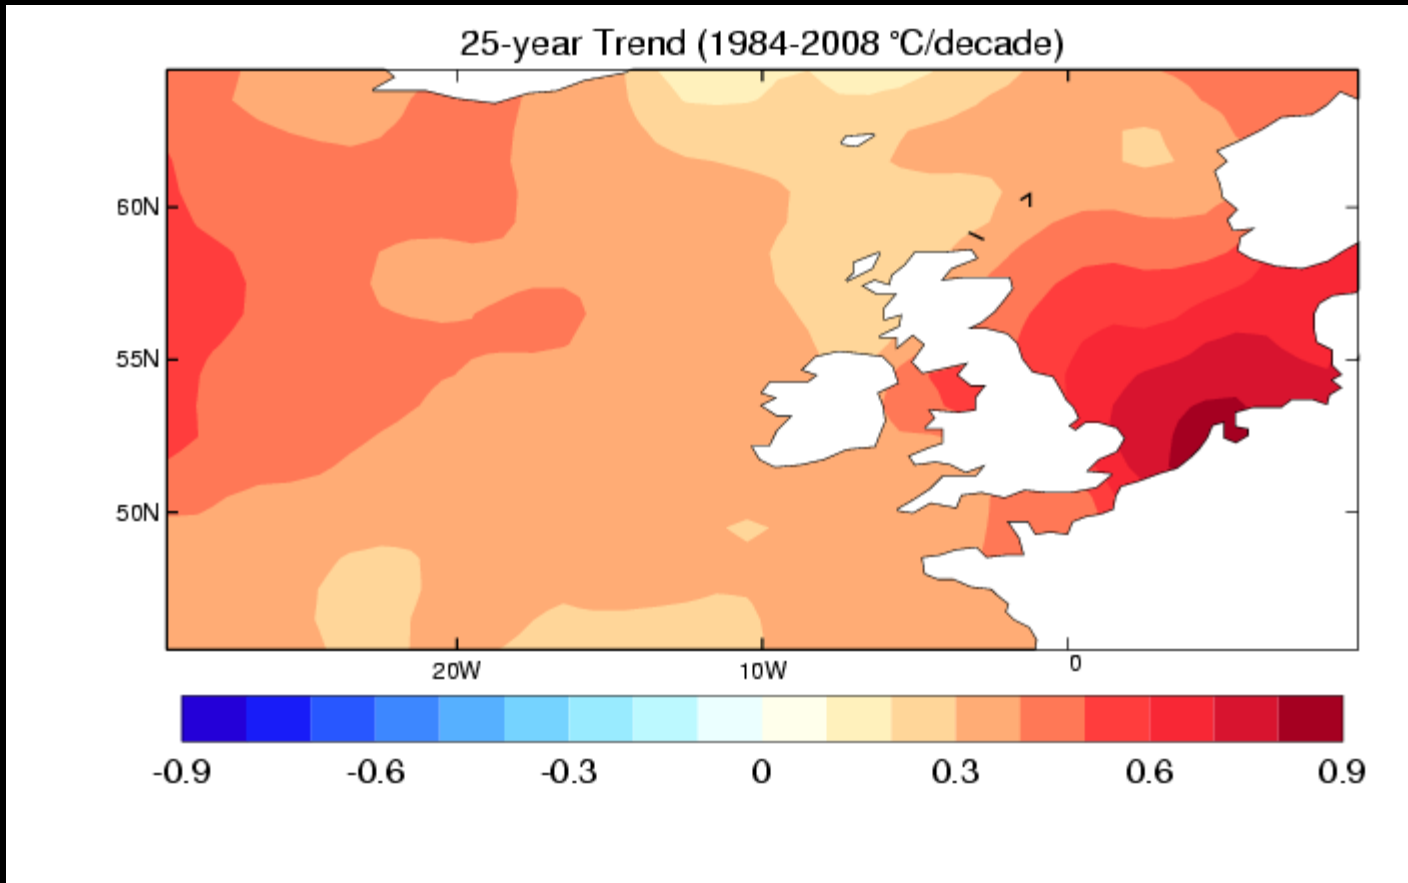

Uses of ATSR data at the Hadley Centre

- ✓ To provide an independent climate data record of the SST ECV from 1991 to present day
- ✓ As input to the climate SST analysis HadISST along with ship, buoys and AVHRR SSTs
- ✓ To identify biases and drifts in current and past *in situ* measurements (e.g. buoys and ships)
- 🌐 *Use of cloud and aerosol products for model validation*
- 🌐 *For use in GSICS to “calibrate other satellite radiometers”*

SST trends around UK

Key messages

- (A)ATSR is now accepted as the “gold standard” for sea surface temperature
- AATSR SSTs are used operationally for NWP forecasts at several European Met Services
- ARC has been a success in reprocessing the complete 1991-2009 (A)ATSR dataset to provide an SST product fit for climate applications
- ARC SSTs will be a key data source for the new SST climate analysis being developed at the Hadley Centre - HadISST3.

Questions and answers
